1 Introduction

This technical note explains the basic steps in order to set up an Ubuntu 20.04 Server for the Skydel Simulation Engine¹ from Orolia². If you follow the installation steps and have Xpra³ running on the server you should be able remotely access your Skydel Simulation Engine over SSH and browser.

2 Usage

2.1 Browser

After setting up the server just visit the URL of your server. There you will see a login screen (figure 1) where you have to provide the username and password which was set while setting up the server. Afterwards the Skydel Simulation Engine will start as a window inside the browser. This method does not need to install any dependencies on the client side except a browser.

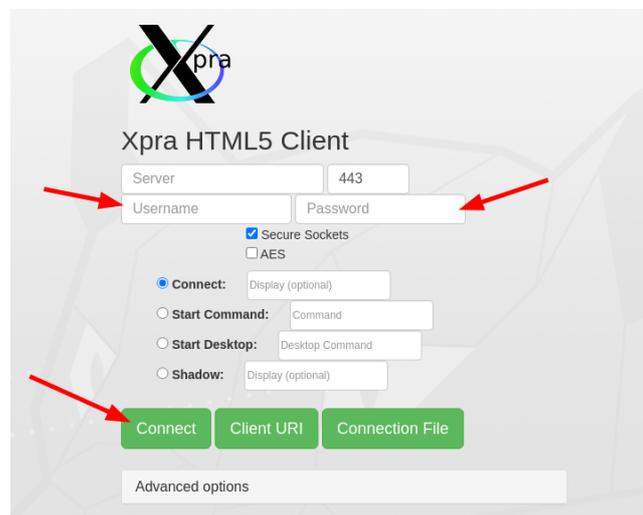

Figure 1: Xpra login screen

2.2 Xpra over SSH

With this method the Skydel Simulation Engine can be forwarded through the SSH Protocol. This way the simulator will run on the server but the Graphical User Interface (GUI) will be forwarded directly to the client computer and can be used like any other program in its own window.

```
$ xpra start ssh:<username>@<address> --dpi=100
```

For this command the user will need to install the xpra software⁴ on the client computer. The command will ask the user to type the password and then the Skydel Simulation Engine window should open. Please refer to the xpra wiki⁵ for a detailed description of the commands.

⁵<https://github.com/Xpra-org/xpra/tree/master/docs/Usage>

3 Setup

In this section the general installation process of the Ubuntu server is described as well as the html server setup.

For the manual it is assumed that there should be three different linux users. This of course can be extended to more users or only a single user can be used.

- **simulator**: Used to run the Skydel software, not used for logins
- **staff**: For trusted employees
- **external**: For external users

The **simulator** user is needed because all instances of the Skydel software have to run as the same linux user. So the idea is to login as **staff** or **external** user but to run the software as **simulator** user. That way external users don't have access on internal research files.

3.1 Ubuntu Server 20.04 LTS

Please follow the instructions on ubuntu.com to install a basic Ubuntu server.

3.1.1 Users and Groups

Create the linux users

```
$ sudo adduser simulator
$ sudo adduser staff
$ sudo adduser external
```

Alter the permissions to the home directories of the users. For an explanation of the linux permissions see Appendix A

```
$ sudo chmod 770 /home/staff/ /home/external/
$ sudo chmod 777 /home/simulator/
$ sudo -u staff mkdir -p /home/staff/Documents
$ sudo -u external mkdir -p /home/external/Documents
$ sudo chmod 775 /home/staff/Documents /home/external/Documents
```

Add the users `staff` and `external` to the `simulator` group

```
$ sudo usermod -aG simulator external
$ sudo usermod -aG simulator staff
```

Allow the users `staff` and `external` to run the Skydel software as user `simulator`

```
$ sudo visudo
# Allow these users to execute the skydel-sdx command without
# password prompt
# xhost + && sudo -u simulator -g staff -i skydel-sdx
staff ALL=(simulator:staff) NOPASSWD: /bin/bash -c skydel-sdx
external ALL=(simulator:external) NOPASSWD: /bin/bash -c skydel-sdx
```

3.1.2 Disable Hibernate

Make sure the server is not hibernating as it can be a hassle to remotely turn it on again

```
$ sudo systemctl mask sleep.target suspend.target hibernate.target
hybrid-sleep.target
```

3.1.3 Nvidia driver

Install a recent driver version for your Nvidia graphics card. This can be for example done like this

```
$ sudo apt install nvidia-460 nvidia-settings
```

3.2 Skydel Software

3.2.1 Installing skydel-sdx

Download the newest software from <https://users.skydelsolutions.com/> and install it

```
$ sudo dpkg -i ~/Downloads/skydel-sdx.deb
```

Ubuntu 20.04 comes with a different libm version, so we need to preload

```
$ sudo bash -c 'echo "export LD_PRELOAD=/lib/x86_64-linux-gnu/libm.so
.6" >> /home/simulator/.profile
```

When first launching the simulator software or when you want to update the license over xpra you could get an error that the license file could not be opened. If this happens launch the software physically on the server with monitor and keyboard. Afterwards it can be started over xpra with the new license.

3.2.2 Skydel-SDX folder linkage

To access the output files, we can link the Skydel-SDX folder to the different users. In this example the `staff` user has access to the full folder, while the `external` user only has access to the Output and API folders.

```
$ sudo ln -s /home/simulator/Documents/Skydel-SDX/ /home/staff/
Documents/
$ sudo -u external mkdir /home/external/Documents/Skydel-SDX
$ sudo ln -s /home/simulator/Documents/Skydel-SDX/Output /home/external
/Documents/Skydel-SDX
$ sudo ln -s /home/simulator/Documents/Skydel-SDX/API /home/external/
Documents/Skydel-SDX
$ sudo chmod -R 755 /home/simulator/Documents/Skydel-SDX/API
```

3.2.3 OpenStreetMap SSL Error

Running the Skydel software under Ubuntu 20.04 you will get a SSL Error. For details please see the [learn.orolia Forum](https://learn.orolia.com/t/openstreetmap-ssl-error/148)⁶. To fix this, simply install the appropriate OpenSSL version (OpenSSL 1.0.2u)

```
$ sudo apt install build-essential checkinstall zlib1g-dev -y
$ curl https://www.openssl.org/source/old/1.0.2/openssl-1.0.2u.tar.gz
$ tar -xf openssl-1.0.2u.tar.gz
$ cd openssl-1.0.2u
$ ./config --prefix=/usr/local/ssl --openssldir=/usr/local/ssl shared
zlib
$ sudo make
$ sudo make test
$ sudo make install
$ sudo bash -c 'echo "/usr/local/ssl/lib" > /etc/ld.so.conf.d/openssl
-1.0.2u.conf'
$ sudo ldconfig -v
$ cd ..
$ rm -r openssl-1.0.2u
```

⁶<https://learn.orolia.com/t/openstreetmap-ssl-error/148>

3.3 HTML Server

3.3.1 Certbot

Certbot enables you to get a certificate, which is needed to enable HTTPS access.

Install the nginx web server

```
$ sudo apt install nginx
```

Install Certbot

```
$ sudo snap install core; sudo snap refresh core
$ sudo snap install --classic certbot
```

Link the executable if this is not done by the snap already

```
$ sudo ln -s /snap/bin/certbot /usr/bin/certbot
```

Get a certificate

```
$ sudo certbot --nginx

# Test automatic renewal
$ sudo certbot renew --dry-run
```

Create a cronjob if it wasn't done automatically

```
$ sudo crontab -e
# minute (0-59),
# |      hour (0-23),
# |      |      day of the month (1-31),
# |      |      |      month of the year (1-12),
# |      |      |      |      day of the week (0-6 with 0=Sunday).
# |      |      |      |      |      commands
0 0,12 * * * /usr/bin/python3 -c 'import
random; import time; time.sleep(random.random() * 3600)' && /usr
/bin/certbot renew --quiet --deploy-hook "/usr/sbin/service
nginx reload"
```

3.3.2 Nginx

Use the configuration files provided in Appendix B and make sure to replace all placeholders.

- /etc/nginx/nginx.conf
- /etc/nginx/snippets/proxy-params.conf
- /etc/nginx/snippets/<address>.cert.conf
- /etc/nginx/snippets/ssl-params.conf
- /etc/nginx/sites-available/xpra

Link the xpra server file and remove the default server file

```
$ sudo ln -s /etc/nginx/sites-available/xpra /etc/nginx/sites-enabled/
$ sudo rm /etc/nginx/sites-enabled/default
```

Start and enable the nginx server

```
$ sudo systemctl enable nginx
$ sudo systemctl start nginx
```

3.3.3 Xpra

The general installation instructions can be found at the xpra GitHub⁷. Here are the commands to install it on ubuntu.

```
# install https support for apt (which may be installed already):
$ sudo apt update
$ sudo apt install apt-transport-https
# add Xpra GPG key
$ wget -q https://xpra.org/gpg.asc -O- | sudo apt-key add -
# add Xpra repository
$ sudo add-apt-repository "deb https://xpra.org/ focal main"
# install Xpra package
$ sudo apt update
$ sudo apt install xpra
```

Xpra has different authentication methods⁸. Here the authentication with a sqlite database is explained.

The sqlite users will be used for authenticating in the browser. They in general could have different names and passwords than the linux users. But for convenience the same names are chosen here.

```
$ sudo chown root:root /etc/xpra/xpra-auth.sdb
$ sudo chmod 660 /etc/xpra/xpra-auth.sdb
$ sudo python3 /usr/lib/python3/dist-packages/xpra/server/auth/
  sqlite_auth.py /etc/xpra/xpra-auth.sdb list
$ sudo python3 /usr/lib/python3/dist-packages/xpra/server/auth/
  sqlite_auth.py /etc/xpra/xpra-auth.sdb add staff <password> staff
  staff
$ sudo python3 /usr/lib/python3/dist-packages/xpra/server/auth/
  sqlite_auth.py /etc/xpra/xpra-auth.sdb add external <password>
  external external
```

Add the users to the xpra group (needed to create sockets)

```
$ sudo gpasswd -a simulator xpra
$ sudo gpasswd -a external xpra
$ sudo gpasswd -a staff xpra
```

Use the configuration files provided in Appendix C and make sure to replace all placeholders.

- /etc/default/xpra
- /usr/lib/systemd/system/xpra.service
- /etc/xpra/conf.d/05_features.conf
- /etc/xpra/conf.d/10_network.conf
- /etc/xpra/conf.d/12_ssl.conf
- /etc/xpra/conf.d/15_file_transfers.conf
- /etc/xpra/conf.d/16_printing.conf
- /etc/xpra/conf.d/20_sound.conf

⁷<https://github.com/Xpra-org/xpra/wiki/Download>

⁸<https://github.com/Xpra-org/xpra/blob/master/docs/Usage/Authentication.md>

- `/etc/xpra/conf.d/30_picture.conf`
- `/etc/xpra/conf.d/35_webcam.conf`
- `/etc/xpra/conf.d/40_client.conf`
- `/etc/xpra/conf.d/42_client_keyboard.conf`
- `/etc/xpra/conf.d/50_server_network.conf`
- `/etc/xpra/conf.d/55_server_x11.conf`
- `/etc/xpra/conf.d/60_server.conf`
- `/etc/xpra/conf.d/65_proxy.conf`

Start and enable the xpra server

```
$ sudo systemctl enable xpra
$ sudo systemctl start xpra
```

4 Access outputs

In order to access the simulator outputs we need to provide remote access to the local files on the server. A very easy solution is to mount the server files over SFTP as external storage into a cloud service.

5 Update

Updating the xpra server happens with the system update commands. However the xpra configuration files could be overridden, so make sure to check them after a system update.

```
$ sudo apt update
$ sudo apt upgrade
```

Appendices

A Linux User permissions

Every file in Unix has the following attributes⁹

- **Owner permissions** - The owner's permissions determine what actions the owner of the file can perform on the file.
- **Group permissions** - The group's permissions determine what actions a user, who is a member of the group that a file belongs to, can perform on the file.
- **Other (world) permissions** - The permissions for others indicate what action all other users can perform on the file.

The file access modes are as follows

- **Read** - Grants the capability to read, i.e., view the contents of the file.
- **Write** - Grants the capability to modify, or remove the content of the file.
- **Execute** - User with execute permissions can run a file as a program.

The following table explains the number format to set permissions

Number	Octal Permission Representation	Ref
0	No permission	---
1	Execute permission	--x
2	Write permission	-w-
3	Execute and write permission: 1 (execute) + 2 (write) = 3	-wx
4	Read permission	r--
5	Read and execute permission: 4 (read) + 1 (execute) = 5	r-x
6	Read and write permission: 4 (read) + 2 (write) = 6	rw-
7	All permissions: 4 (read) + 2 (write) + 1 (execute) = 7	rwX

B Nginx configuration files

Make sure to replace the following placeholders:

- `<address>` - URL (without http/https) where to reach the server
- `<resolver>` - replace with the IP address of your resolver

The config files are embedded into the pdf and can be downloaded by clicking on the title of the box (may not work with all pdf readers)

B.1 `/etc/nginx/nginx.conf`

 `/etc/nginx/nginx.conf`

```
user www-data;
worker_processes auto;
pid /run/nginx.pid;
include /etc/nginx/modules-enabled/*.conf;

events {
    worker_connections 768;
    # multi_accept on;
}

http {
    sendfile on;
    tcp_nopush on;
    tcp_nodelay on;
    keepalive_timeout 65;
    types_hash_max_size 2048;
    server_tokens off;

    include /etc/nginx/mime.types;
    default_type application/octet-stream;

    gzip on;

    server {
        listen 80;
        #listen [::]:80;
        server_name <address>;
        # enforce https
        return 301 https://$server_name$request_uri;
    }

    # Virtual Host Configs
    include /etc/nginx/conf.d/*.conf;
    include /etc/nginx/sites-enabled/*;
}
```

B.2 /etc/nginx/snippets/proxy-params.conf

 /etc/nginx/snippets/proxy-params.conf

```
proxy_set_header Host $host;
proxy_set_header X-Real-IP $remote_addr;
proxy_set_header X-Forwarded-For $proxy_add_x_forwarded_for;
proxy_set_header X-Forwarded-Proto $scheme;
proxy_set_header X-Forwarded-Host $server_name;
proxy_set_header X-Forwarded-Ssl on;
proxy_set_header Upgrade $http_upgrade;
proxy_set_header Connection "upgrade";
proxy_http_version 1.1;
```

B.3 /etc/nginx/snippets/<address>.cert.conf

 /etc/nginx/snippets/<address>.cert.conf

```
# certs sent to the client in SERVER HELLO are concatenated in
  ssl_certificate
ssl_certificate /etc/letsencrypt/live/<address>/fullchain.pem; #
  managed by Certbot
ssl_certificate_key /etc/letsencrypt/live/<address>/privkey.pem; #
  managed by Certbot

# verify chain of trust of OCSP response using Root CA and
  Intermediate certs
ssl_trusted_certificate /etc/letsencrypt/live/<address>/chain.pem;
```

B.4 /etc/nginx/snippets/ssl-params.conf

 /etc/nginx/snippets/ssl-params.conf

```
# Certbot security settings
include /etc/letsencrypt/options-ssl-nginx.conf; # managed by Certbot

# Diffie-Hellman keys to prevent man-in-the-middle when private server
  key is leaked
ssl_dhparam /etc/letsencrypt/ssl-dhparams.pem; # managed by Certbot

# HSTS (ngx_http_headers_module is required) (63072000 seconds)
add_header Strict-Transport-Security "max-age=63072000" always;

# OCSP stapling
ssl_stapling on;
ssl_stapling_verify on;

# replace with the IP address of your resolver
resolver <resolver>;
```

B.5 /etc/nginx/sites-available/xpra

 /etc/nginx/sites-available/xpra

```
server {
    listen 443 ssl http2;
    #listen      [::]:443 ssl http2; # Ipv6 is disabled on the server
    server_name  <address>;

    access_log /var/log/nginx/skydel-simulator.access.log;
    error_log /var/log/nginx/skydel-simulator.error.log;

    include snippets/<address>.cert.conf;
    include snippets/ssl-params.conf;

    location / {
        include snippets/proxy-params.conf;
        proxy_pass http://127.0.0.1:10000/;
    }
}
```

C Xpra configuration files

Make sure to replace the following placeholders:

- `<address>` - URL (without http/https) where to reach the server

The config files are embedded into the pdf and can be downloaded by clicking on the title of the box (may not work with all pdf readers)

C.1

 `/etc/default/xpra`

```
BIND_TCP=0.0.0.0:10000
#BIND_TCP=0.0.0.0:80

#####
# SSL Options
#
# Please refer to the python ssl module for details

# Key file to use:
#ssl-key = /path/to/keyfile
ssl-key = /etc/letsencrypt/live/<address>/privkey.pem

# Certificate file to use:
#ssl-cert = /path/to/cert
ssl-cert = /etc/letsencrypt/live/<address>/fullchain.pem

# Specifies which version of the SSL protocol to use:
#ssl-protocol = SSLv23
ssl-protocol = TLSv1_2

# The ca_certs file contains a set of concatenated 'certification
  authority' certificates:
#ssl-ca-certs = default
#ssl-ca-certs = /path/to/cacertfile
#ssl-ca-certs = /path/to/cacertsdir/

# Whether to try to verify the client's certificates
# and how to behave if verification fails:
#ssl-client-verify-mode = none
#ssl-client-verify-mode = optional
#ssl-client-verify-mode = required
ssl-client-verify-mode = optional

# Whether to try to verify the server's certificates
# and how to behave if verification fails:
#ssl-server-verify-mode = none
#ssl-server-verify-mode = optional
#ssl-server-verify-mode = required
ssl-server-verify-mode = required

# Whether to match the peer cert's hostname:
ssl-check-hostname = on

# Server hostname to check for:
#ssl-server-hostname = localhost

# The following options require Python 2.7.9 or later:
```

```
# The flags for certificate verification operations:
#ssl-verify-flags = DEFAULT
#ssl-verify-flags = CRL_CHECK_LEAF
#ssl-verify-flags = CHECK_CHAIN
ssl-verify-flags = X509_STRICT

# Sets the available ciphers for this SSL object:
#ssl-ciphers = ALL
#ssl-ciphers = HIGH
ssl-ciphers = DEFAULT

# Set of SSL options enabled on this context:
#ssl-options = ALL
#ssl-options = OP_NO_TLSv1,NO_COMPRESSION
